

## Fix for corrupted carriage lift parameters

If carriage gap set up routine was started & canceled by mistake, system will go in error “Internal Software Error 99999999000171”. Accordingly,

- System will go in permanent “Carriage Lift” Error
- A full restart will not help
- System will not accept running the routine once again

### Solution:

Run the following command in terminal window and press <Enter> ..... Restart the Vutekd and run the lift calibration again.

```
echo 'INSERT INTO Defaults VALUES ("CarriageLiftCalibrated", 0, 0, 0, NOW())' | mysql -uvutek01 -pvutek01 printdb
```
